

# Teacher Allocation — Guide

VTMS - vCrop Technologies

*This guide explains how teachers are allocated to schools, how the classes-per-day number and the specific class list relate to each other, the 6-classes/day daily cap, and how de-allocation and cancellation work.*

## Who can do what

| Action                                                                                                                | Who                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Add a teacher, Allocate, Edit classes, De-allocate, Cancel de-allocation, Enable/Disable login, Reset password</b> | vCrop Admin only                                                                                                                    |
| <b>View teachers</b>                                                                                                  | vCrop Admin sees everyone; Org Admin / Cluster Coordinator / Head Teacher see only teachers currently active at their own school(s) |

## Two ways to allocate a teacher

| Path                           | How it works                                                                                                                                                                                                                         |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Linked to a Requirement</b> | Pick a requirement whose candidate was Final Selected — this auto-fills the school and classes/day, and tries to auto-match the teacher by candidate name. Completing the allocation automatically marks that requirement Completed. |
| <b>Manual, no requirement</b>  | Fill in Teacher, School, and Classes per day yourself — used for allocations that did not go through the Requirements/Resumes pipeline at all.                                                                                       |

Optionally list specific Class + Section + Subject rows at allocation time, or leave it for later via "Edit classes."  
Duplicate class/section rows are blocked before submission.

## Classes per day vs. the specific class list

Classes per day (a plain number) and the specific Class/Section/Subject list are edited independently, so they can drift apart — e.g. allocated at 3/day, then 6 specific rows added later via "Edit classes" without ever revisiting the number. VTMS always uses whichever is larger as the real daily commitment, so a concretely-listed class can never go silently uncounted.

Effective classes/day = max(Classes per day, number of specific class rows listed). If more specific rows are added than the original number, the number is automatically bumped up to match — never down.

## The 6-classes/day cap

A school day has 6 class periods, so 6 is the most a single teacher can be committed to across all their active schools combined — not a per-school limit. A teacher spread across two schools at 3 and 2 classes/day (5 of 6 total) still counts as Available; a teacher maxed out at 6/6 in a single school does not, even though they only have one school.

## Editing classes later

"Edit classes" lets you add, change, or remove Class/Section/Subject rows for any of a teacher's active allocations — one section per school. Duplicate class/section rows are blocked per school. If the edited list ends up longer than the current classes/day number, that number is bumped up automatically to match, exactly like at allocation time.

## De-allocating a teacher

| Field                    | Notes                                                                                        |
|--------------------------|----------------------------------------------------------------------------------------------|
| <b>School</b>            | Pick which specific school to end — other active allocations for this teacher are untouched. |
| <b>Last working date</b> | Can be a past or future date.                                                                |

A future last working date means the teacher is still genuinely teaching there until that date — they do not disappear from the school's active list immediately. Only once today's date passes the last working date does the allocation actually drop off. De-allocating notifies Org Admin, the school's Head Teacher and Cluster Coordinator, and the teacher themselves — every message includes the actual last working date.

### Cancel de-allocation

Available only while a de-allocation is still pending — i.e. the last working date has not passed yet. Cancelling restores the allocation to active and clears the last working date entirely, as if the de-allocation never happened. Once the last working date has actually passed, the allocation has fully expired and this option no longer applies.

### Teacher account actions

Separate from allocation itself: Enable/Disable toggles the teacher's ability to log in at all, and Reset password issues a new password — both apply to any teacher who has a linked login account, regardless of their current allocation status.

### Filters on the Teachers screen

| Filter               | Matches                                                                                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>All</b>           | Every teacher in scope.                                                                                                                           |
| <b>Not allocated</b> | Zero active school allocations.                                                                                                                   |
| <b>Available</b>     | Total effective classes/day across all active allocations is under 6 — spare daily capacity, regardless of how many schools that's spread across. |
